## Single number evaluation metric

To choose a classifier, a well-defined development set and an evaluation metric speed up the iteration process.

Example : Cat vs Non- cat

y = 1, cat image detected

s ŷ		Actual class y				
clas		1	0			
Predict	1	True positive	False positive			
	0	False negative	True negative			

**Precision** 

Of all the images we predicted y=1, what fraction of it have cats?

**Precision (%)** =  $\frac{True \ positive}{Number \ of \ predicted \ positive} x \ 100 = \frac{True \ positive}{(True \ positive+False \ positive)} x \ 100$ 

<u>Recall</u>

Of all the images that actually have cats, what fraction of it did we correctly identifying have cats?

Recall (%) =  $\frac{True \ positive}{Number \ of \ predicted \ actually \ positive} x \ 100 = \frac{True \ positive}{(True \ positive+False \ negative)} x \ 100$ 

Let's compare 2 classifiers A and B used to evaluate if there are cat images:

Classifier	Precision (p)	Recall (r)
А	95%	90%
В	98%	85%

In this case the evaluation metrics are precision and recall.

For classifier A, there is a 95% chance that there is a cat in the image and a 90% chance that it has correctly detected a cat. Whereas for classifier B there is a 98% chance that there is a cat in the image and a 85% chance that it has correctly detected a cat.

The problem with using precision/recall as the evaluation metric is that you are not sure which one is better since in this case, both of them have a good precision et recall. F1-score, a harmonic mean, combine both precision and recall.

F1-Score= 
$$\frac{2}{\frac{1}{p} + \frac{1}{r}}$$

Classifier	Precision (p)	Recall (r)	F1-Score
А	95%	90%	92.4 %
В	98%	85%	91.0%

Classifier A is a better choice. F1-Score is not the only evaluation metric that can be use, the average, for example, could also be an indicator of which classifier to use.
